Asymmetric Information, Relational Contracts and Prices:
Evidence from an Experiment with Potato Farmers in Pakistan

Online Appendix: Pre-Specified Analysis*

Sher Afghan Asad   Omar Hayat Gondal   Farah Said

July 2026

*The trial is registered at AEA RCT registry ID # AEARCTR-0012787. This appendix reproduces the pre-specified analysis plan for the registered trial and accompanies the current working paper based on the same randomized controlled trial. The title of the accompanying paper may differ from the registered title.

Contents

1 Departures from PreSpecified Analysis

The pre-specified outcome variable measuring the proportion of sample markets in which farmers sold potatoes (sale_markets) was excluded from the analysis due to insufficient variation. All farmers who reported their market for potato sales sold in only one market, and 96% sold their potatoes in one of the 17 sample markets, leaving little variation for statistical analysis.

2 Main Analysis

2.1 Primary Outcomes

Table 1: ITT Estimates: Sales, Quantities, Prices and Profits (2024)

	(1) ln(Sales_2024)	(2) ln(Sales_2024)	(3) ln(Quantity_2024)	(4) ln(Quantity_2024)	(5) ln(Costs_2024)	(6) ln(Costs_2024)	(7) ln(Price_2024)	(8) ln(Price_2024)	(9) ln(Profit_2024)	(10) ln(Profit_2024)
Treated	-0.001		0.008		-0.087		-0.011		0.026	
	(0.124)		(0.112)		(0.110)		(0.036)		(0.153)	
Treatment 1		-0.011		-0.024		-0.165		0.006		-0.004
		(0.134)		(0.117)		(0.114)		(0.044)		(0.154)
Treatment 2		0.010		0.041		-0.008		-0.029		0.058
		(0.142)		(0.123)		(0.119)		(0.042)		(0.202)
Observations	991	991	991	991	991	991	991	991	991	991

Note: This table presents intent-to-treat estimates for sales, quantities, prices and profits for the pooled and disaggregated treatment estimations. ”ln(Sales_2024)” is the log of total sales value received by the farmer in PKR per hectare of total cultivated area. ”ln(Quantity_2024)” is the log of total quantity sold by the farmer in KGs per hectare of total cultivated area. ”ln(Costs_2024)” is the log of total costs of the farmer in PKR per hecatare of total cultivated area. ”ln(Price_2024” is the log of the total price received by the farmer in PKR/KG. ”ln(Profit_2024)” is the log of the profit of the farmer from the 2024 season in PKR per hectare of total cultivated area. Each regression controls for whether the farmer sold potatoes in 2023, as well as the corresponding 2023 values of log of total sales value, log of total quantity sold, log of total costs, log of total price received, and log of profits. Strata fixed effects were used. Standard errors are clustered at the patwar-circle (PC) level throughout this appendix (77 PCs among the 991 farmers in the main analysis sample).

Table 2: ITT Estimates: Sales, Quantities, Prices and Profits (2025)

	(1) ln(Sales_2025)	(2) ln(Sales_2025)	(3) ln(Quantity_2025)	(4) ln(Quantity_2025)	(5) ln(Price_2025)	(6) ln(Price_2025)
Treated	0.098 (0.162)		0.089 (0.175)		-0.001 (0.048)	
Treatment 1		0.018 (0.168)		-0.001 (0.193)		0.011 (0.058)
Treatment 2		0.176 (0.182)		0.178 (0.200)		-0.014 (0.064)
Observations	322	322	322	322	322	322

Note: This table presents intent-to-treat estimates for sales, quantities, prices and profits for the pooled and disaggregated treatment estimations. ”ln(Sales_2025)” is the log of total sales value received by the farmer in PKR per hectare of total cultivated area. ”ln(Quantity_2025” is the log of total quantity sold by the farmer in KGs per hectare of total cultivated area. ”ln(Price_2025” is the log of the total price received by the farmer in PKR/KG. Each regression controls for the corresponding 2024 values of log of total sales value, log of total quantity sold, and log of total price received. Strata fixed effects were used. Standard errors are clustered at the patwar-circle (PC) level throughout this appendix.

Table 3: LATE Estimates: Sales, Quantities, Prices and Profits (2024)

	(1) ln(Sales_2024)	(2) ln(Sales_2024)	(3) ln(Quantity_2024)	(4) ln(Quantity_2024)	(5) ln(Costs_2024)	(6) ln(Costs_2024)	(7) ln(Price_2024)	(8) ln(Price_2024)	(9) ln(Profit_2024)	(10) ln(Profit_2024)

2.2 Secondary Outcomes

Table 13: ITT Estimates: Harvest Costs

	(1) ln(Harvest Cost Farmer '24)	(2) ln(Harvest Cost Farmer '24)	(3) ln(Harvest Cost Buyer '24)	(4) ln(Harvest Cost Buyer '24)	(5) Harvest Cost Share '24	(6) Harvest Cost Share '24
Treated	-0.190		0.198		-0.008	
	(0.195)		(0.413)		(0.024)	
Treatment 1		-0.374*		0.878*		-0.053**
		(0.204)		(0.476)		(0.025)
Treatment 2		-0.000		-0.509		0.039
		(0.256)		(0.450)		(0.026)
Observations	991	991	991	991	991	991

Note: Outcomes are ln(Harvest Cost, Farmer) and ln(Harvest Cost, Buyer), $\ln(\text{cost} + 1)$ of harvest-time costs borne by the farmer and by the buyer respectively, and Harvest Cost Farmer's Share, the farmer-paid share of total harvest costs (farmer plus buyer). The $+1$ shift accommodates farmers with zero cost on that side of the transaction. Farmer-paid cost is zero for only 2.4% of the sample, but buyer-paid cost is zero for roughly 87%; columns (3)–(4) should be read with that large zero mass in mind, since a $\ln(x + 1)$ average blends it with a thin, highly skewed set of non-zero payers. Reported harvest-cost values were checked against reported prices and profits and corrected for flagged data-entry errors prior to any transformation. The main paper (Section 6.3) reports this margin instead as an extensive-margin (share of farmers with any buyer-paid cost) and intensive-margin (conditional amount paid) decomposition, which is not sensitive to this issue. Treated is a pooled indicator for assignment to either treatment arm; Treatment 1 (Single Channel) and Treatment 2 (Dual Channel) are the disaggregated arm indicators, each relative to Control. Standard errors, clustered at the patwar-circle (PC) level, are reported in parentheses. *** p<0.01, ** p<0.05, * p<0.10.

Table 14: LATE Estimates: Harvest Costs

	(1) ln(Harvest Cost Farmer '24)	(2) ln(Harvest Cost Farmer '24)	(3) ln(Harvest Cost Buyer '24)	(4) ln(Harvest Cost Buyer '24)	(5) Harvest Cost Share '24	(6) Harvest Cost Share '24

Observations	977	977	975	975

Note: Outcomes are the number of buyers/agents the farmer considered before selling, and the number of days taken to find a buyer and complete the sale. Treated is a pooled indicator for assignment to either treatment arm; Treatment 1 (Single Channel) and Treatment 2 (Dual Channel) are the disaggregated arm indicators, each relative to Control. Rows report the interaction of pooled and disaggregated treatment assignment with a binary indicator for baseline agricultural empowerment, testing whether the treatment effect varies along this dimension. Standard errors, clustered at the patwar-circle (PC) level, are reported in parentheses. *** $p<0.01$, ** $p<0.05$, * $p<0.10$.

Observations	977	977	977	977	977	977

Note: Outcomes are ln(Harvest Cost, Farmer), the log of harvest-time costs borne by the farmer, and Harvest Cost Farmer's Share, the farmer-paid share of total harvest costs (farmer plus buyer). Treated is a pooled indicator for assignment to either treatment arm; Treatment 1 (Single Channel) and Treatment 2 (Dual Channel) are the disaggregated arm indicators, each relative to Control. Rows report the interaction of pooled and disaggregated treatment assignment with a binary indicator for whether the farmer had an understanding with the buyer on quantity to be sold in 2024, testing whether the treatment effect varies along this dimension. Standard errors, clustered at the patwar-circle (PC) level, are reported in parentheses. *** p<0.01, ** p<0.05, * p<0.10.

3.18 Expected Time to Sale

The pre-specified concept for this dimension is the time available, from the baseline survey, for the intervention to affect the farmer's sale (PAP, Followup 2, item 18). This is constructed from the farmer's baseline-reported expected sale date (not date of harvest, which is a distinct event in the data), as the gap between the baseline survey date and the earliest such date reported; the raw variable is winsorized at the 5th/95th percentile to bound a small number of implausible outliers before the sample is split at the median.

Table 140: Heterogeneous Treatment Effects: Sales, Quantities, Prices and Profits, by expected time to sale

Note: Outcomes are Plant Potato (Expectation 2025) (intention to cultivate potatoes again in 2025), New Agent (Expectation 2025) (intention to consider a new Commission Agent), and Credit Constraint (Expectation 2025) (self-reported credit constraint), all reported at the 2024 endline, not realised 2025 outcomes. Treated is a pooled indicator for assignment to either treatment arm; Treatment 1 (Single Channel) and Treatment 2 (Dual Channel) are the disaggregated arm indicators, each relative to Control. Rows report the interaction of pooled and disaggregated treatment assignment with a binary indicator for (winsorized) baseline expected time to sale, testing whether the treatment effect varies along this dimension. Standard errors, clustered at the patwar-circle (PC) level, are reported in parentheses. *** p<0.01, ** p<0.05, * p<0.10.

3.19 K-Means Clustering

We cluster on all 18 pre-specified dimensions (median-split to binary, per the pre-analysis plan's own footnote); the eighteenth, expected time to sale, was added 22 Jul 2026 (see *Departures from Pre-Specified Analysis* above – it had not previously been operationalised anywhere in the codebase). We use $k = 3$ clusters (the pre-analysis plan does not specify a number). Because k-means cluster labels are otherwise arbitrary, the three clusters are relabelled by a simple resource-profile score (the row-sum of the 17 socioeconomic-capacity binary dimensions, with the food-insecurity indicator inverted since it is coded in the opposite direction to every other dimension) so that Cluster 1 always denotes the lowest-scoring group and Cluster 3 the highest, regardless of how the algorithm numbers them. Expected time to sale is deliberately excluded from the resource score itself – it reflects survey timing relative to the farmer's own sale, not a socioeconomic capacity – but is still one of the 18 inputs to the clustering.

4 Attrition

The pre-analysis plan (Section 4) commits to testing for differential attrition between treatment arms, by repeating the baseline balance-test specification with a round-specific attrition dummy as the outcome. Table 4 reports this test for each of the three post-baseline survey rounds (in-person endline, phone reminder, phone follow-up), for both the pooled Treatment indicator and the disaggregated Treatment 1/Treatment 2 indicators.

5 Robustness

The pre-analysis plan (Section 5) commits to two robustness checks repeating the main ITT estimation: (i) village fixed effects in place of randomisation-strata fixed effects, and (ii) post-double-selection with LASSO using the baseline covariates listed in the baseline PAP.

5.1 Village Fixed Effects

This check is not estimable given the realised randomisation design. Randomisation was conducted at the patwar circle (PC) level, and every sampled village sits entirely within a single PC; as a result, treatment assignment has zero within-village variation (confirmed directly in the data: 0 of 98 villages show any variation in Treated, Treatment 1, or Treatment 2). Village fixed effects are therefore perfectly collinear with treatment, and the treatment coefficient cannot be identified under this specification. This is a mismatch between the pre-analysis plan (drafted before the final randomisation level was confirmed) and the implemented design, not a computational issue, and is logged as a PAP deviation rather than silently omitted.

5.2 Post-Double-Selection LASSO

Candidate controls are the respondent and household baseline variables listed in the baseline pre-analysis plan (Section 3.2): male, age, education, numeracy, experience, empowered_1, empowered_2, trust, household size, assets, cultivated area, and food insecurity. Village fixed effects, also named as a candidate control in the pre-analysis plan, are excluded here for the same reason given above: treatment has zero within-village variation, so including village dummies as LASSO candidates would let the treatment-equation selection step pick enough of them to reproduce the same non-identification problem.
